

Alkecoin (AKE) - Tokenomics Paper v1.0

1. Overview

Alkecoin (AKE) is the native utility token of the Alkebuleum Blockchain, a network designed for transparent, low-cost, and reputation-driven on-chain operations.

AKE serves one purpose only: to enable network usage. It is the gas unit that powers smart contract execution, on-chain governance actions, and decentralized applications (dApps) across the Alkebuleum ecosystem.

2. Core Attributes

Ticker	AKE
Type	Native Utility Token
Network Consensus	PORA – Proof of Reputable Authority
Chain ID	237422
Decimals	18
Target Block Time	~5 seconds
EVM Compatibility	Fully compatible
Fee Model	EIP-1559 (base fee burn + tip)

3. Token Purpose

AKE is used for:

- **Transaction Fees:** Paying gas to execute transactions and smart contracts.
- **Computation Priority:** Validators prioritize transactions offering higher tips.
- **Network Access:** Required to deploy or interact with dApps and contracts.
- **Treasury Operations:** DAO and Foundation disbursements occur in AKE.
- **Security Incentives:** Validator block rewards and operational reimbursements.

AKE **is not an investment** and does not confer ownership, dividends, or voting rights.

4. Supply and Genesis Allocation

Total Genesis Supply: 1,000,000,000 AKE (fixed)

Decimals: 18

Allocation	%	AKE Amount	Purpose
Foundation / Treasury	45%	450,000,000	Long-term sustainability and governance reserves
Dev Team	15%	150,000,000	Core development, SDKs, wallets, network upgrades
Sponsorship (Identity & Reputation)	20%	200,000,000	Locked for gas sponsorship, onboarding, and reputation proof
Initial Community Usage	15%	150,000,000	Faucets, builder grants, education incentives
Validator Refunding (Ops Fund)	5%	50,000,000	Validator operation cost reimbursement
Total	100%	1,000,000,000 AKE	

5. Vesting & Distribution Rules

Allocation	Vesting Policy	Distribution Control
Foundation / Treasury	10-year sustainability plan	Foundation Council (multisig/DAO transition)
Dev Team	12-month cliff, 36-month linear	KPI-based vesting (verified milestones)
Sponsorship Pool	Permanently locked for gas sponsorship	DAO-managed smart contract
Community Usage	Programmatic releases (quarterly)	DAO-approved faucet & grants
Validator Fund	SLA-based reimbursements	DAO + Validator Committee

6. Monetary Policy

6.1 Base Inflation

- **Block reward:** 0.1 AKE per block
- **Approximate yearly issuance:** ~630,720 AKE
- **Annual inflation rate:** ~0.063% (extremely low)

This ensures:

- Long-term sustainability without excessive dilution.
- Predictable validator rewards under PORA.
- Compatibility with deflationary burns (EIP-1559).

6.2 Burns

- Every transaction burns the **base fee**.
- Higher network usage → higher burn rate → potential deflation.
- DAO may also execute **discretionary burns** from treasury reserves (excluding Sponsorship pool) to balance supply.

7. Sponsorship Program (20%)

Purpose:

To ensure everyone — regardless of financial means — can access the network's identity and reputation tools.

Use Cases:

- Free or subsidized creation of **Alkebuleum Identity accounts**
- Reputation & verification transactions (attestations)
- Education and nonprofit blockchain interactions
- DAO-approved public-good actions

Governance:

- **Managed by DAO:** through a locked Sponsorship smart contract.
- **Access Control:** only allowlisted contracts/methods.
- **Anti-Abuse:** per-account cap, verification via Identity, transparent logs.

8. Validator Economics (PORA Model)

Aspect	Description
Validator Selection	Reputation-based, reviewed periodically
Rewards	0.1 AKE/block + performance reimbursements from Ops Fund
Requirements	Uptime >95%, verified node, diverse geography
Penalties	Refund denial, temporary suspension, rotation
Goal	Reward transparency and service reliability over staking power

9. Governance & Oversight

- **DAO-governed levers:**
 - Block reward adjustment
 - Treasury disbursements
 - Sponsorship rules

- Discretionary burns
- Community unlock pacing

- **Reporting cadence:**

Quarterly transparency reports published on-chain or via Alkebuleum.org showing:

- Allocation spend
- Fee burn totals
- Inflation rate
- Sponsorship usage

10. Market Conduct & Compliance

AKE was not distributed via ICO or speculative fundraising, but it is available for public acquisition and use to access services on the Alkebuleum Network. It functions as a utility-first token, enabling payment of transaction fees, deployment of contracts, and participation in on-chain activities.

Tokens may be earned, granted, or purchased on authorized markets for immediate network usage. AKE does not represent equity, dividends, or investment rights, and it remains aligned with public-utility token standards under web3 and nonprofit frameworks.

11. Summary Snapshot

Metric	Value
Ticker	AKE
Total Supply	1,000,000,000
Inflation	~0.063% / year
Fee Model	EIP-1559 burn + tip
Consensus	PORA
Governance	DAO + Foundation
ICO	None
Purpose	Network gas, usage access
Stability Policy	Low issuance + EIP-1559 burn + DAO-adjusted supply management
